

L

inductor

Figure 1: L — Inductor Element.

Form:

`l:<instance name> n1 n2 <parameter list>`

`n1` is the positive element node,

`n2` is the negative element node.

Parameters:

Parameter	Type	Default value	Required?
<code>l</code> : Inductance value (H)	DOUBLE	N/A	yes
<code>int_res</code> : Internal resistance value (ohms)	DOUBLE	1e-08	no
<code>time_d</code> : Flag, if true, calculate in the time domain as if a nonlinear element.	BOOLEAN	false	no

Example:

```
l:13 5 8 1mH
```

```
l:11 1 2 l=1e-9 time_d=0
```

Notes:

This is the L element in the SPICE compatible netlist.

This is a linear element and is normally calculated as a linear element in time- and frequency-domain analyses.

The parameter `time_d` indicates that the element should be treated as if it were a nonlinear element in transient analysis. Normally a linear element (as when `time_d = false`) is calculated in the time-domain by filling a MNAM for the entire linear partition. This is done just once. With `time_d = true` the element is calculated as it would be in Spice.

The internal resistance `int_res` is required to improve the conditioning of the MNAM in transient analysis.
